

Children

- Children 4 and younger represent 52% of all child fire deaths under the age of 15. These children are often unable to escape from a fire independently.
- 46% of injuries to children due to fire occur between the ages of 0 to 4.
- 86% of deaths and 81% of injuries among children due to fire occur in residential properties.

A working smoke alarm dramatically increases your chance of surviving a fire. Please remember to practice a home escape plan frequently with your family.
